Project Name : Banking and Loan Management System

Duration : 2 months

Framework : Agile & scrum Methodology

Product Description :

1.This Product is based on Financial system that we are mainly focusing on customer requirements to full fill their needs and provide the good amount of the loans to the customer.

2.In this system there are several loans are available and also we have home banking facility is also present in our product.

3. In home banking, may be some customers are getting some issues while opening the loans through mobile because some softwares are not working in the product.

4. This product is not only giving the loans but also having some requirements to give the loans, customer should provide necessary documents to open the loan.

5.like we have home, automobile loans are available so, they have to submit guarantee documents to get the loans

6. In this process we have to develop and validate that provided docs through our application and we will work on the application to issues will get done by your company.

7. so, I need the team to design this application and maintain regular data of customers who is linking with our system.

Requirements for the Product :

1.Login and Register page when user is having proper user name and password

2.Home page i.e in this page we have to display all the details like loan application(home,Automobile,education) ,create bank account.

3.Loan management page -in this we are creating loans and we are maintain the loans document details all details should be in this page only

4.Create bank account page-in this customer will opening diff types of bank accounts to maintain transaction details of the customers

Roles in Agile : 1. Product owner

               2.Scrum master

               3.Team Lead and Team members

1.Product owner :

The person who is own the product and get issues from the customers and discuss with the scrum master to get it done by the team
